- Both reverse and middle are very simple. - For a detailed description of their functionality and options, please refer to the Tools description (2nd paragraph) Command Line Usage: - If binary tools are invoked from the command line, their configuration files are not taken in consideration. Their default behavior is the default is to be executed. - So the usage is the same as for any binary tool. For instance: - "./reverse -i datafile newdatafile" will perform the reverse on datafile - "./middle -i datafile newdatafile" will perform the middle on datafile - However, please note that for tools with options, many, these options are listed in their own section of the command-line (for instance: "./midletool -o 2 –in datafile -out newdatafile" will perform the middle on datafile and write the output to newdatafile using 2 bytes per row (default: 1 byte per row)). API Usage: - If tools are invoked from a Python program using their API, their configuration files are taken in consideration. The API is invoked simply like this: - For instance: - "importBinaryTools_reverse" to reverse a file - "importBinaryTools_middle" to perform the middle on a file - Please note that the API is now used to interact with the binary tools. When a binary tool is invoked from a Python program with an API, its behaviour is unchanged. The binary tools still do what they always did. The purpose of the API is to allow programmatic access to these tools. - To get the list of configuration files that are currently available and that are read when the binary tools are invoked using the API, see the "class BtToolsRegistry" (this class is available in the tests/btTools.py file). When using an API, it will be possible to get the parameters of each binary tool as-well-as their configuration files. However, you cannot get their arguments in the same way as in the command line (so if you use "./middle -i datafile newdatafile" to perform the middle on datafile, you won't be able to get the content of datafile directly from the API). While working with the binary tools, their arguments, for instance when invoked with "./midletool -o 2�
